Wolves

These four songs always help me stay focused when I am coding and doing homework.

display 屬性

The `display` property controls how an element is rendered on the page.

It determines whether the element behaves as a **block element** or an **inline element**, and affects how it participates in the layout flow.

Different `display` values can change the layout behavior of an element, which may influence its relationship with other elements.

Common `display` values include:

- `block`
- `inline`
- `inline-block`
- `none`
- `flex`
- `grid`

Please refer to :

<https://developer.mozilla.org/en-US/docs/Web/CSS/Reference/Properties/display>

block (Block-level Elements 塊級元素)

When an element's `display` property is set to `block`, it behaves as a block-level element.

This means:

- The element occupies the entire width of its parent container.
- It always starts on a new line.
- It can have **width, height, padding, and margin** applied.

Common HTML tags that are block-level by default:

- `<div>`
- `<p>`
- `<h1> – <h6>`
- `<section>`
- `<article>`
- `<header>`
- `<footer>`

`inline` (Inline Elements 行内元素)

Elements displayed as `inline` are called inline elements.

Characteristics:

- They do not occupy an entire line.
- They only use the width necessary for their content.
- They can appear side-by-side with other inline elements.
- They cannot set `width` or `height`.
- Vertical padding and margin do not affect surrounding layout.

Common inline HTML tags include:

- `<span>`
- `<a>`
- `<em>` (Italic)
- `<strong>` (Bold)
- `<img>` (images are considered inline elements)

flex (Flexible Box Layout 彈性佈局)

`flex` is a powerful layout model that allows us to create flexible, responsive layouts. When a container's `display` is set to `flex`, its child elements are arranged and adjusted according to `flex` rules.

`flex` supports:

- Horizontal or vertical alignment
- Automatic resizing
- Wrapping
- Easy spacing and distribution

Common flex properties :

- `justify-content`: controls alignment along the main axis
- `align-items`: controls alignment along the cross axis
- `flex-wrap`: controls whether items wrap to the next line

Please refer to: <https://www.casper.tw/css/2017/07/21/css-flex/>

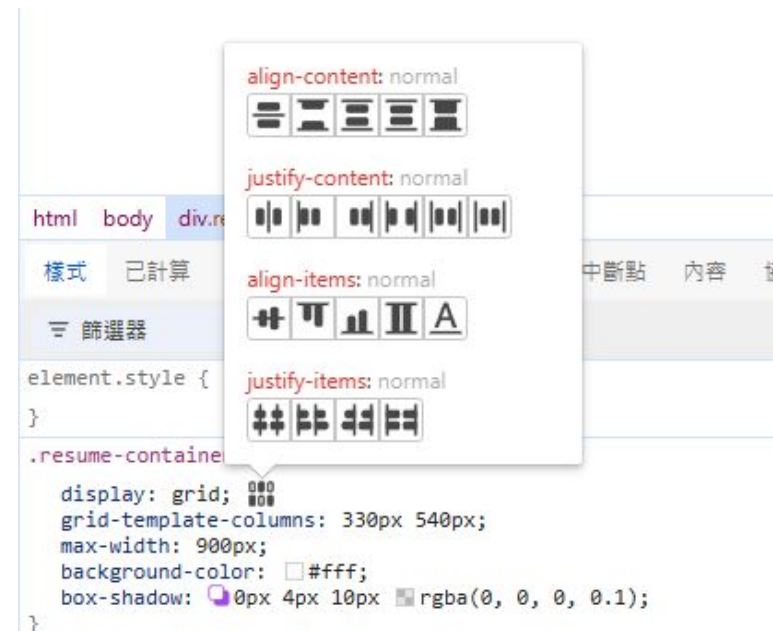

grid (Grid Layout 網格佈局)

`grid` is another powerful layout model used to create two-dimensional, grid-based layouts.

When a container uses `display: grid`, its children are arranged into rows and columns, with precise control over spacing and size.

Common grid properties:

- `grid-template-columns`: defines column count and width
- `grid-template-rows`: defines row count and height
- `grid-gap`: controls spacing between rows and columns

Please refer to :

https://developer.mozilla.org/zh-TW/docs/Web/CSS/Guides/Grid_layout/Basic_concepts

Some properties
help you improve the overall look of your webpage...

`border-radius` (**Rounded Corners 圓角邊框**)

When `border-radius` is applied, the corners of an element become rounded, making the layout look softer and more polished.

Commonly used for buttons, cards, images, and other box elements.

Common usage:

- `border-radius: 10px;` – sets all four corners to 10px
- `border-radius: 10px 0 10px 0;` – sets corners in the order: top-left, top-right, bottom-right, bottom-left
- `border-radius: 50%;` – creates a circular shape (often used with fixed width & height for profile photos)

`line-height` (**Line Spacing** 行距)

`line-height` controls the vertical spacing between lines of text.

It significantly affects text readability and the overall typography of a webpage.

Commonly used for paragraphs and headings to ensure clean, easy-to-read layout.

Examples:

- `line-height: 1.5;` – relative spacing based on the font size
- `line-height: 24px;` – fixed pixel spacing
- `line-height: 120%;` – spacing using percentage values

`list-style` (List Marker Style 清單樣式)

`list-style` controls the symbol or marker displayed before list items (`<ul>` or `<ol>`).

It can also remove the marker entirely for custom styling.

Common usage:

- `list-style: disc;` - default round bullet (for `<ul>`)
- `list-style: decimal;` - numbered list (for `<ol>`)
- `list-style: none;` - removes the marker (useful for custom designs)
- `list-style-image: url('icon.png');` - uses an image as the list marker

Favorite Music

我把我的青春給你

灰色と青

樹枝孤鳥

Wolves

These four songs always help me stay focused when I am coding and doing homework.

Requirement #1

Container Design

- The layout should be placed within a container (`.main-container`) that that is **centered** on the page.
- The container should have a **fixed width** (example is `1000px`) and a **background color** that you like.
- The container should be a **flex layout** to divide the page into a left panel and a right panel.
- The container should have slightly **rounded corners** and a **soft shadow effect** to make the layout look cleaner and more modern.

```
example : body {  
    background-color: #eeed1;  
    display: flex;  
    justify-content: center;  
    align-items: center;  
    padding: 20px;  
}
```

Requirement #2

Panel Division

- The layout must be divided into two panels:
 - **Left Panel:** Contains personal information, profile picture, and contact info.
 - **Right Panel:** Displays sections like Education, Skill, Homework & Lab, and Favorite Music.
- The panels should have defined widths:
 - Left panel: about **30% of the container width**. (or you can define as you want)
 - Right panel: about **70% of the container width**. (or you can define as you want)
 - When using percentage widths, avoid adding large left/right padding on both panels, or your layout may overflow.

Requirement #3

Left Panel Structure

- The left panel (`.left-panel`) should be divided into two main `div` elements:
 - **Photo Panel (`.photo-panel`)**
 - Place a profile image using `<img>` or `<background-image>`.
 - The image should fill the panel width (for example, `width: 100%`).
 - **Text Content Panel (`.text-content`)**
 - An **About Me** section: a short self-introduction paragraph.
 - A **Contact Info** section: a list of contact methods, such as email, GitHub, phone number, or social media links.
 - At the bottom of the text content, include the **NCCU icon** (e.g., school logo) as an image, ideally in the form of an `img` tag or an SVG.

Requirement #4

Right Panel Structure

- The right panel (`.right-panel`) should be divided into several sections using `<div class="section">`:
 - **Education**
 - **Skill**
 - **Homework & Lab**
 - **Favorite Music**
- Each section should have:
 - A title using an `<h2>` element with class `.section-title`.
 - A bottom border under the title to visually separate the title from the content.

灰色と青

樹枝孤鳥

Wolves

These four songs always help me stay focused when I am coding and doing homework.

Requirement #5

Education Section

- The **Education** section should display a simple **timeline style** of your education experience.
- Each item should include:
 - A **year range** (for example, 2024 - Now, 2020 - 2024) with **class .year**.
 - A **description** of the school and department with **class .description**.
 - The year and description should be placed side by side in one line.
 - Ensure that the contents are clearly readable, and that there is sufficient margin or padding between timeline items for a clean layout.

Education

2024 - Now	M.S. in Management Information Systems, NCCU
2020 - 2024	B.S. in Management Information Systems, NCCU
2017 - 2020	High School Student in PCSH

Requirement #6

Skill Section

- The Skill section should list several skills (for example: Python, HTML, CSS, Git).
- Each skill should be displayed as a small tag using a `<span>` with class `.tag`.
- The skill tags should:
 - Be displayed inline.
 - Have padding and **rounded corners** to look like badges.
 - Use a light background color and a darker text color to create contrast.
 - You should list **at least 4 skills**.

Skill

Python

HTML

CSS

Git

Requirement #7

Homework & Lab Section

- Below the title, the content should be divided into two columns:
 - Left column: **Homework**
 - Right column: **Lab**
- Use a container to create a **two-column layout** (for example, using `display: flex`).
- Each column (`.hw-column`, `.lab-column`) should:
 - Have its own subtitle `<h3>` (e.g., “Homework”, “Lab”).
 - Contain a list of item links.
 - Have a light background color, padding, and rounded corners to make them look like cards.
- The homework and lab links should:
 - Be **clickable** to external homework URLs (GitHub links).
 - Not have an underline by default. Instead, you can apply other design techniques (such as changing the text color or adding hover effects) to **indicate that the links are clickable**.

- [Lab2 – Homepage](#)

Requirement #8

Favorite Music Section

- The Favorite Music section should include:
 - **A title “Favorite Music”.**
 - **A row of four music items, each representing a song.**
- Each music item should:
 - Be wrapped in an `<a>` tag to link to a YouTube, Spotify, KKBOX, etc. URL.
When clicked, it should open the corresponding song or music video.
 - Contain an image (such as an album cover or music icon) with a uniform size and aspect ratio.
 - Display the song title below the image.
- The four music items should be **aligned in a single row**, evenly spaced and properly aligned.
- Ensure that the **images are centered in the row**.
- Below the row of music items, **add a short note (.music-note)** that explains why you chose these songs, or in what situations you like to listen to them (for studying, relaxing, etc.).

Favorite Music

我把我的青春給你

灰色と青

樹枝孤鳥

Wolves

These four songs always help me stay focused when I am coding and doing homework.

Additional Reminder

1. All images must have alt text.

Every `<img>` tag should include a short and meaningful description

2. Make sure all links work correctly.

Test every `<a>` link (homework, lab, favorite music, GitHub, etc.) and confirm that it opens the correct page.

3. Verify the page on GitHub Pages.

After you push your files, open your GitHub Pages URL and check that: the CSS is loaded, all images are shown, all links and layout look correct.

4. No strict requirements on design details.

There is no fixed rule for font size, colors, margin or padding values.

The main goal of this homework is to correctly use HTML elements and apply CSS to structure and style the page.

Submission Rule

1. File names: **StudentID_CSS_HW.html** and **StudentID_CSS_HW.css**
2. Deadline: **Nov. 20 (THU), 11:59pm**
3. Submission method:
 - Submit through the GitHub repo created in Week 3.
 - In your repo, create a folder named **HW6_CSS**, place all files inside (including “images” folder with all images placed in it), and push to GitHub.
 - Submit the **Deployed GitHub Page URL** to your **StudentID_CSS_HW.html** file to Moodle.
 - The assignment will strictly follow naming and submission rules.
 - **Put images in the folder and push to GitHub.**
